## 1. Introduction

### 1.1. Purpose

The purpose of this system is to manage user authentication for a web application. The system will allow users to register accounts, log in, access their profile, and log out securely.

### 1.2. Scope

This system will handle:

- User registration with firstname, lastname, email, username, and password
- Login authentication with email/username and password
- Profile access for authenticated users only
- Logout functionality
- Prevention of unauthorized access to protected pages

#### Boundaries:

- Does **not** include password recovery/reset
- Does **not** include multi-factor authentication
- Focused on a single web application environment

### 1.3. Definitions, Acronyms, and Abbreviations

#### Term & Definition

UI -Interface

ERD -Entity Relationship Diagram

Auth -Authentication

API -Application Programming Interface

JWT -JSON Web Token, for secure session management

React -Frontend library for building UI

Spring Boot -Backend Java framework

## 2. Overall Description

### 2.1. System Perspective

The system is a **web-based authentication module** integrated into a larger application. It communicates between:

- **Frontend (React UI)** for user interaction
- **Backend (Spring Boot API)** for authentication logic
- **Database** to store user credentials and session information

## 2.2. User Classes and Characteristics

User Type	Characteristics
Guest User	Can register and log in; cannot access protected pages
Authenticated User	Has logged in; can view profile and log out

## 2.3. Operating Environment

- **Frontend:** ReactJS
- **Backend:** Spring Boot
- **Database:** MySQL/PostgreSQL
- **Tools:** Postman (API testing), Git, Maven/Gradle

## 2.4. Assumptions and Dependencies

- Users have internet access and a modern web browser
- Database is available and properly configured
- Backend and frontend will be hosted on servers accessible to users
- JWT or session management will be used for authentication

# 3. System Features and Functional Requirements

Describe each major feature of the system and its functional requirements.

## 3.1. Feature 1: User Registration

Description:

Allows a guest user to create a new account with firstname, lastname, email, username, and password.

### Functional Requirements:

- User provides firstname, lastname, email, username, and password
- System validates input (email format, password strength)
- System stores hashed password in database
- Confirmation message is displayed

### 3.2. Feature 2: User Login

Description:

Allows a registered user to authenticate and access protected pages.

#### Functional Requirements:

- User submits email/username and password
- System validates credentials
- System creates a session or JWT token
- Authenticated user is redirected to profile

### 3.3 Feature 3: View Profile

Description:

Allows authenticated users to view their personal information and account details.

#### Functional Requirements:

- Protected route checks authentication
- User information is retrieved from the database
- Dashboard displays username, email, and other relevant data

### 3.4 Feature 3: Logout

Description:

**Allows authenticated users to log out and invalidate their session.**

#### Functional Requirements:

- System terminates the session/JWT
- User is redirected to login page
- Protected pages are inaccessible after logout

## 1. Non-Functional Requirements

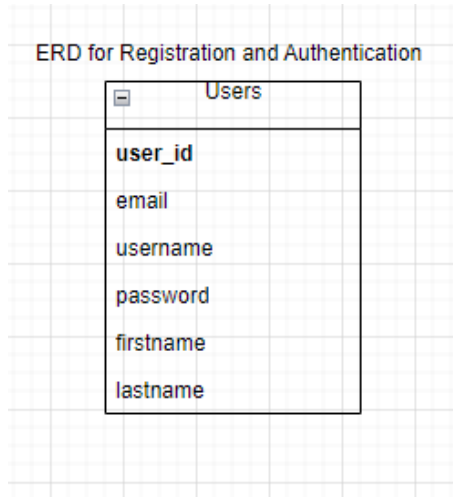

Specify system quality attributes such as performance, security, usability, reliability, etc.

- **Performance:** API responses under 500ms
- **Security:** Passwords hashed, JWT tokens used
- **Usability:** Clear error messages for login/registration failures
- **Reliability:** System available 99% of the time
- **Scalability:** Support for thousands of concurrent users

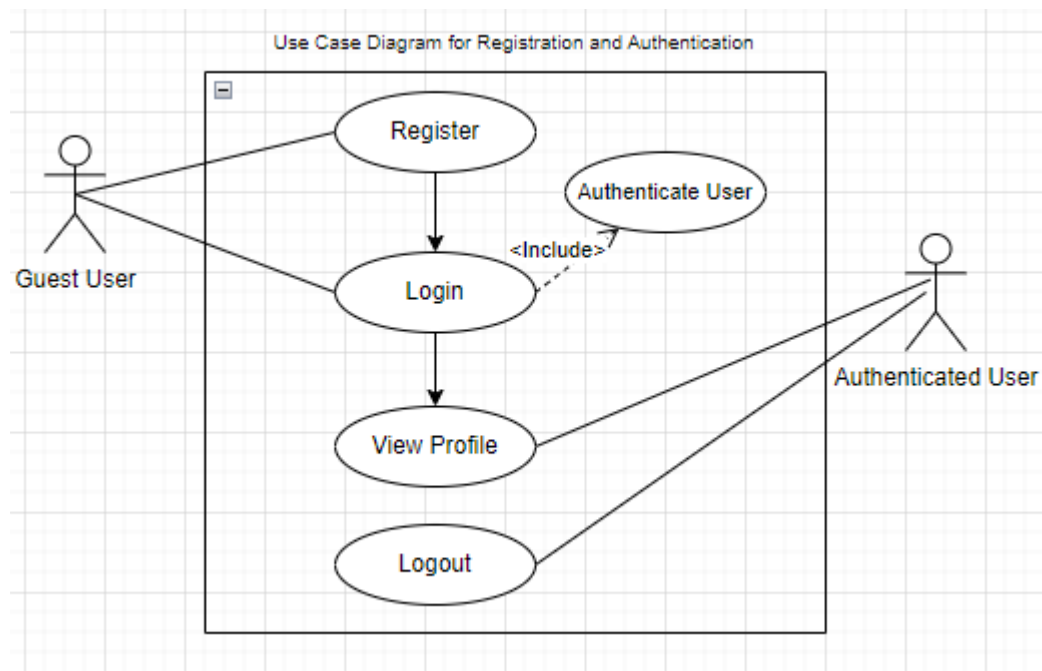

## 2. System Models (Diagrams)

*Insert the necessary diagrams for the system:*

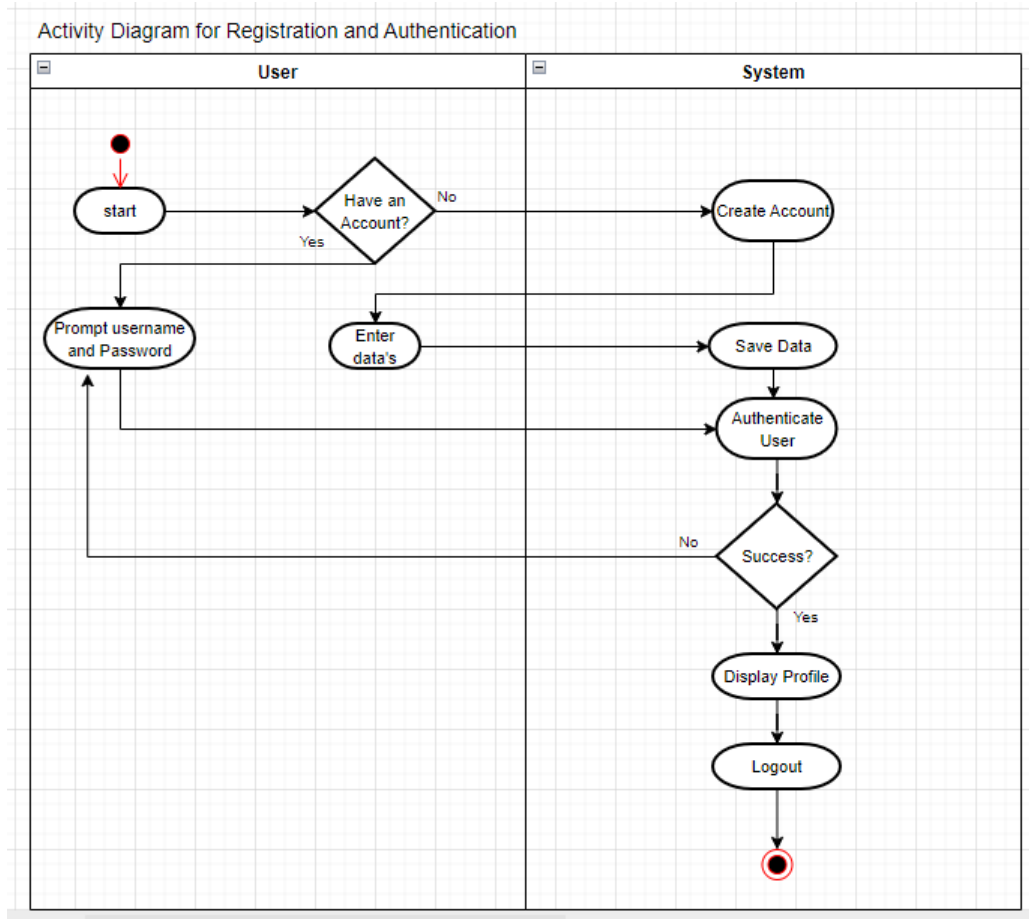

### 2.1. ERD

### 2.2. Use Case Diagram

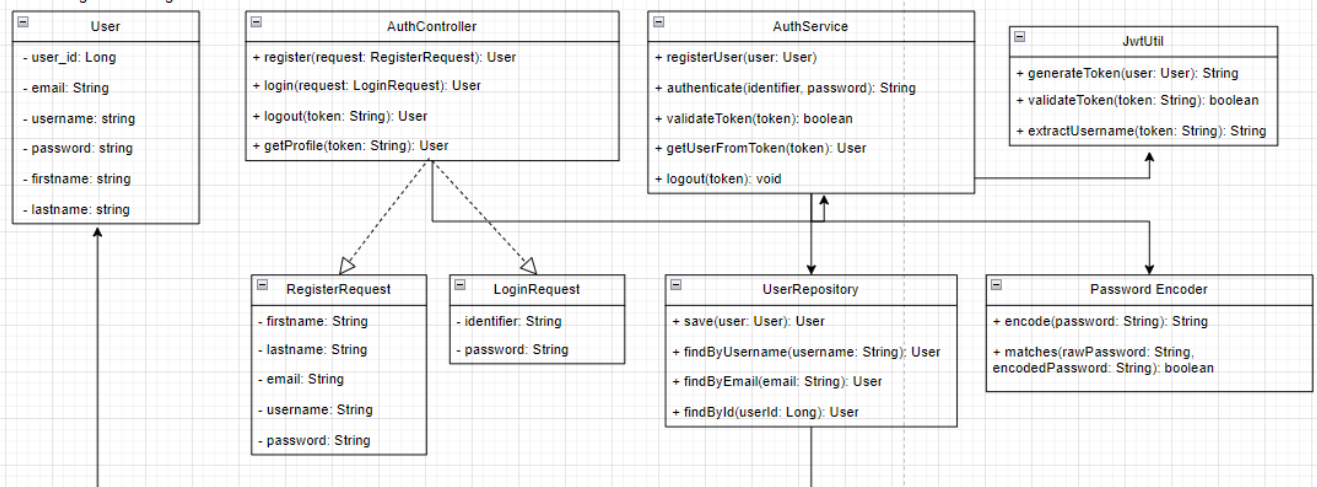

## 2.3. Activity Diagram

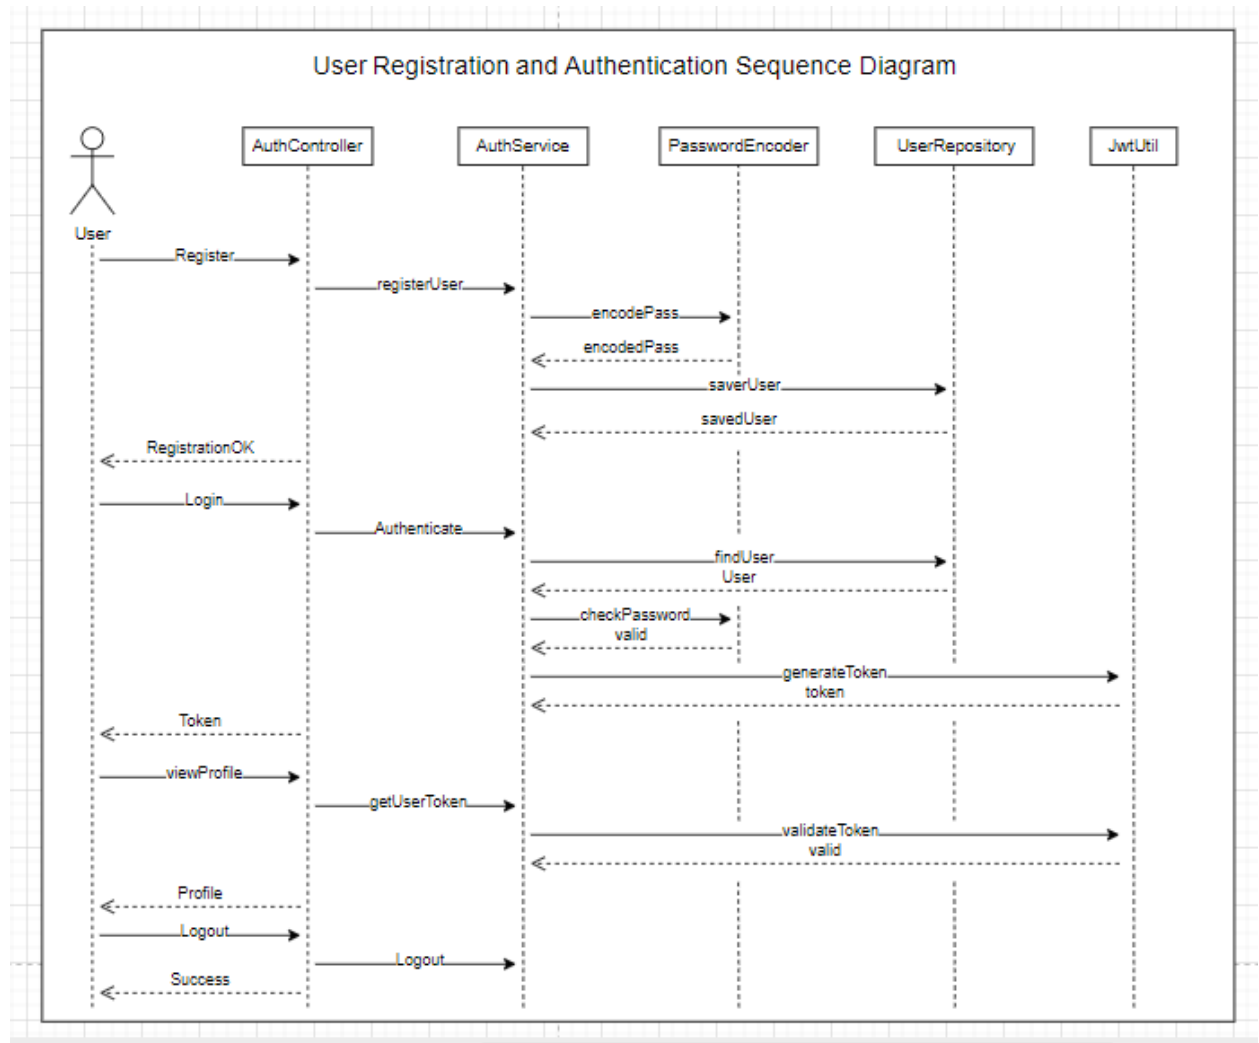

## 2.4. Class Diagram

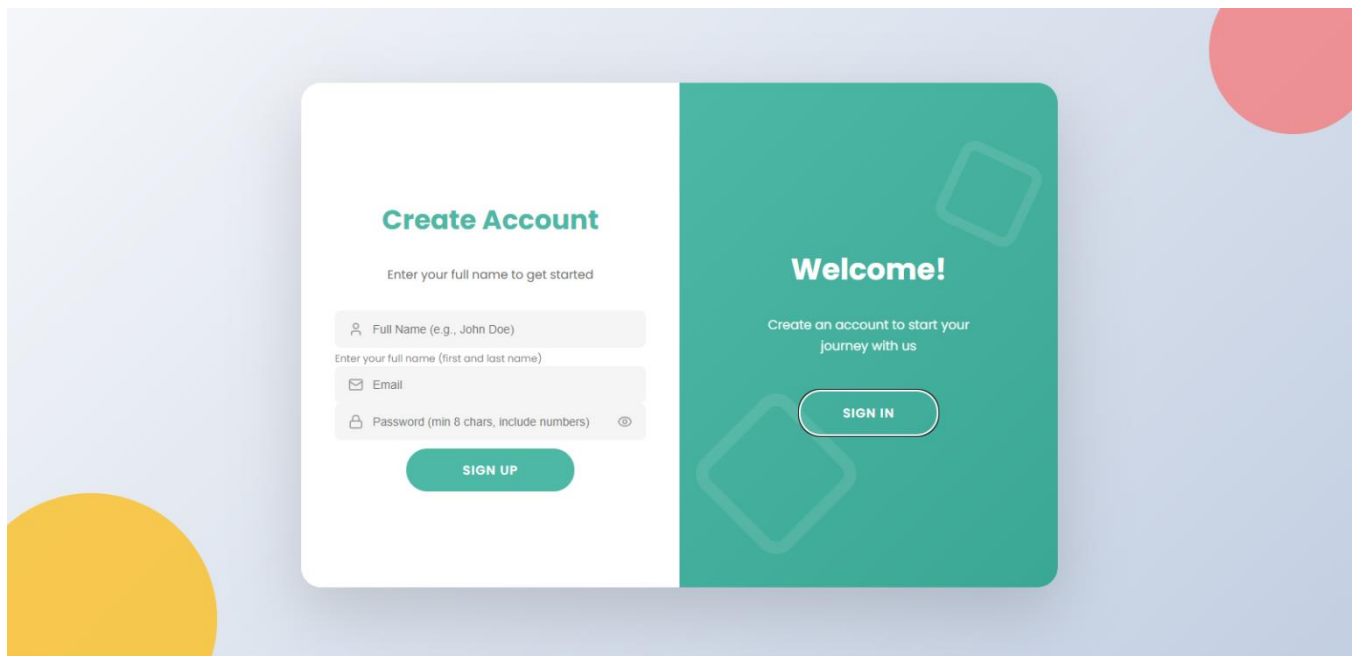

Class Diagram for Registration and Authentication

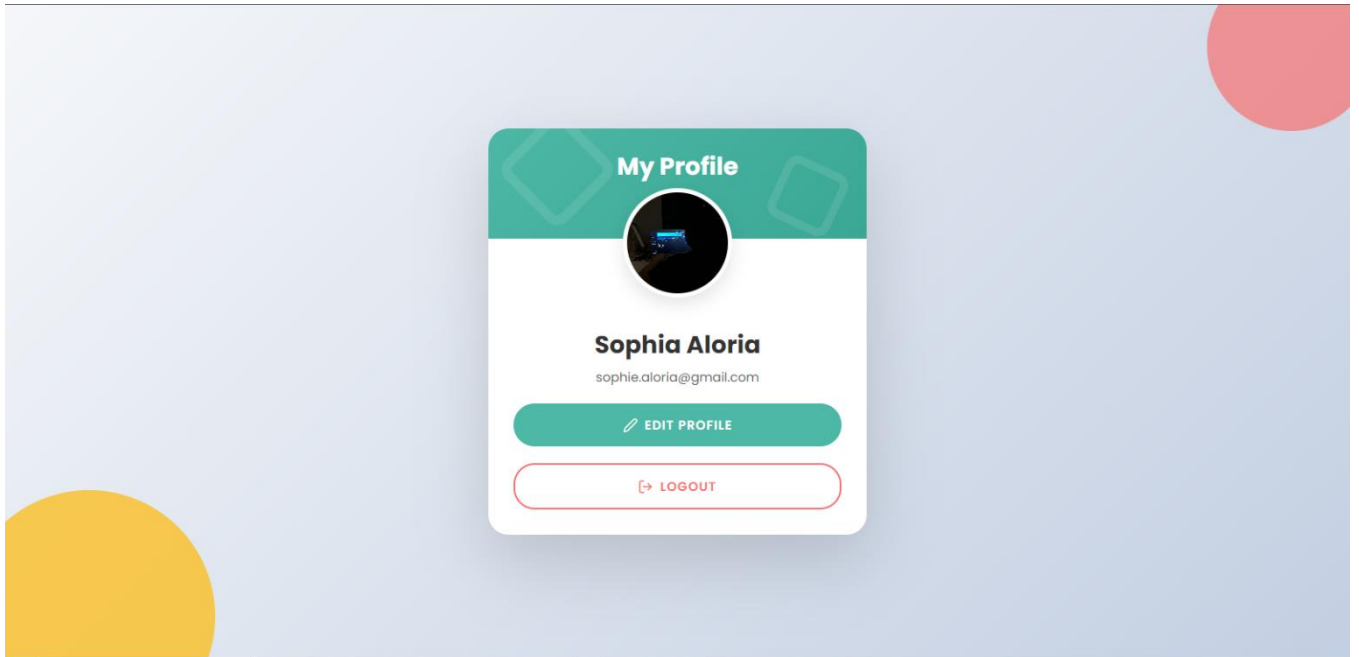

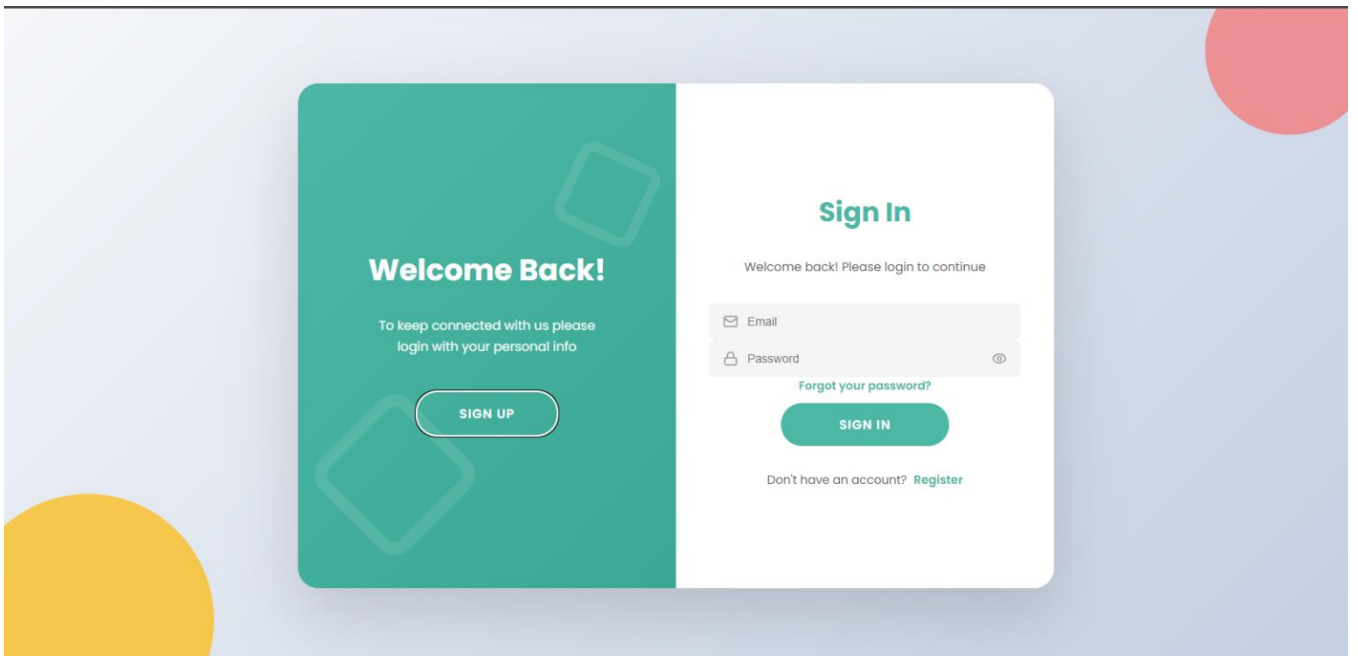

## 2.5. Sequence Diagram

## Screenshots of the WEB UI

### 3. Appendices

This section contains supporting materials and references used in the development of the User Authentication System.

#### A. References

- Spring Boot Official Documentation – <https://spring.io/projects/spring-boot>
- ReactJS Documentation – <https://react.dev>
- JSON Web Token (JWT) Introduction – <https://jwt.io/introduction>
- REST API Design Best Practices – <https://restfulapi.net>
- OWASP Authentication Guidelines – <https://owasp.org>

#### B. Supporting Diagrams

- Use Case Diagram – User Account Management
- Class Diagram – Authentication System Structure
- Sequence Diagram – User Authentication Flow
- ERD – User Database Structure

#### C. Tools and Technologies

- Frontend: ReactJS
- Backend: Spring Boot
- Database: MySQL / PostgreSQL
- Version Control: Git & GitHub
- API Testing Tool: Postman
